ABSTRACT

The Influence of the Project for Strengthening the Pancasila Student Profile (P5) on the Achievement of the Pancasila Student Profile at SDN Tanamera I: 2024. Nurhayati

Keywords: *Project for Strengthening the Profile of Pancasila Students (P5), Profile of Pancasila Students*

Teacher skills in implementing P5 activities are one effort to improve students' critical thinking abilities. Teachers' lack of knowledge about project activities to strengthen the profile of Pancasila students (P5) is the first factor causing students' low critical thinking abilities, because if a teacher does not understand what is being conveyed then students will find it difficult to accept it. The second factor, namely the lack of facilities and infrastructure in project activities to strengthen the profile of Pancasila students (P5), is also the cause of students' low critical thinking abilities. This is because P5 activities are not optimal due to incomplete facilities and infrastructure. The aim of this research is to determine the influence of the project to strengthen the Pancasila student profile (P5) on the achievement of the Pancasila student profile in the critical reasoning dimension at SDN Tanamera I.

This research uses a quantitative approach with a pre-experimental design type of research with a one group pretest-posttest design model. The subjects in this research were teachers and students at SDN Tanamera I. The data collection technique in this research was using tests.

The results of the research conducted in class IV can be proven from the validity test that the test instrument for this research contained 10 valid questions, then the questions were declared valid and then tested for reliability, obtaining results of 0.819 on the pretest and 0.741 on the posttest with a high category with a reliability coefficient > 0.70. The results obtained showed a significant increase seen from the average pretest (50.71) and posttest (85.71) scores which showed an increase in results. Furthermore, from the results of the N-gain test it is known that the sig value is 0.7263, in accordance with the decision making rules in the N-Gain test that the value of 0.7263 is greater (>) 0.70. From the results of the normality test, a value was obtained of 0.148 on the pretest and 0.200 on the posttest, with the criteria for accepting normally distributed data, namely if the probability is > 0.05. Then, from the results of the simple linear regression test, a value of 0.000 was obtained on the pretest and posttest with the condition being smaller (<) 0.05. And the R Square test results obtained a value of 0.246 on the pretest and 0.972 on the posttest, with a strong category with an R Square coefficient of 0.75. seen from the results of the determination test (R Square) the independent variable has an influence on the dependent variable. So it can be concluded that H1 is accepted and HO is rejected, meaning that the project to strengthen the profile of Pancasila students (P5) has an influence on the achievement of the profile of class IV Pancasila students at SDN Tanamera I.
